Northstar Cloud Company Overview

Operating model, product principles, ownership, and company terminology.

OWNER	EFFECTIVE	STATUS
Strategy & Operations	15 July 2026	Approved / quarterly review

Company at a glance

Northstar Cloud is a fictional B2B software company that provides governed operations automation for customer support, identity operations, revenue operations, and compliance teams. Its product combines visual workflows, accountable human decisions, AI agents, and audited connector actions.

FACT	VALUE
Legal name	Northstar Cloud Ltd.
Headquarters	Bengaluru, India; remote-first workforce
Customer segment	Mid-market and enterprise organizations
Support hours	24 x 7 for Sev-1; business hours for Sev-2 and Sev-3
Primary regions	India, United Kingdom, European Union, United States
Default data region	Customer-selected region; no cross-region movement without approval

Product principles

- Accountability over autonomy: agents may recommend and execute bounded actions, while people retain consequential decisions.
- Evidence before action: every important decision should reference current customer context, company policy, and connector state.
- Least privilege by default: each workflow, user, agent, and connector receives only the access needed for its declared purpose.
- Observable execution: runs expose input, outputs, approvals, external-action receipts, retries, cost, and provenance.
- Graceful failure: missing data, unavailable connectors, rejected approvals, and invalid model output must stop safely and explain the next step.

Teams and ownership

TEAM	RESPONSIBILITY	CONTACT
Customer Operations	Incident response, onboarding, and customer communications	customer-ops@northstar.example
Platform Operations	Runtime, reliability, releases, and connector execution	platform-ops@northstar.example
Security & Compliance	Security policy, risk acceptance, investigations, and audits	security@northstar.example
Knowledge Operations	Source ownership, freshness, access policy, and retrieval quality	knowledge@northstar.example

Customer promise

Northstar Cloud will never represent an action as completed without a verifiable execution receipt. Customer-facing communications must distinguish observed facts, inferred conclusions, proposed actions, completed actions, and remaining uncertainty.

Terminology

A workflow is a versioned operational process. An agent is a bounded reasoning capability used by one or more workflow steps. A connector is an authorized interface to an external system. A run is one immutable execution of a published workflow version. A receipt is evidence returned by an external action or accountable human decision.

Knowledge governance

CONTROL	COMPANY STANDARD
Ownership	Every source has a named business owner and review cycle.
Freshness	Policy and runbook sources are reviewed quarterly; product FAQs monthly.
Authorization	Workspace membership alone does not override source-level access policy.
Supersession	A newer approved source replaces, but does not silently rewrite, prior evidence.
Retrieval	Agents receive only relevant authorized chunks plus stable source provenance.

Operating measures

Northstar tracks time to accountable owner, approval wait time, connector-action success, recovery verification, policy-source freshness, and the percentage of agent recommendations supported by explicit evidence. It does not treat model confidence as proof of correctness.
